If you've just recently switched from PC to Mac, you've probably noticed that instead of the Internet Explorer or Edge you're used to, your Mac has its own proprietary browser called Safari. In fact, if you try to search for download Internet Explorer for Mac you will quickly notice that the exact IE equivalent on mac does not exist. What do you do then? Interestingly, in the early world web in the late 1990s, Internet Explorer was the default browser on all Macs. But when Apple introduced Safari as the new default browser in 2003, Microsoft decided to stop developing IE for Mac shortly thereafter. So unless you run Mac OS X 10.6 or earlier (why would you do it?), there's no way to directly install Internet Explorer on your Mac. And you definitely shouldn't use the pre-2003 versions of Internet Explorer now. How to use Internet Explorer on Mac Although the native release of Internet Explorer on mac is not possible, there are other ways to simulate iE for the mac experience. You can mask Safari as different versions of Internet Explorer or Microsoft Edge, you can also install a virtual machine and launch IE for Mac that way, or you can simply choose to use any other browser to available on macOS. Simulate Internet Explorer on Mac with Safari Most of the time, if you need to use Internet Explorer on mac, it's probably for testing purposes, to see for sure or web applications perform or to access websites that require you to use iE (yes, these still exist). Both use cases could be easily performed by Safari. To use Internet Explorer with Safari, you just need to enable developer tools: In Safari, go to Preferences > AdvancedCheck Show Develop menu in the menu bar You can now access developer tools directly from Safari, which allow you to inspect websites, empty caches and, most importantly, simulate a variety of other browsers through the Safari

app. To use Microsoft Edge or Internet Explorer on Mac: Go to the Develop menu in the Safari bar>Navigate for User Agent menu and select the browser you're looking for, be it Microsoft Edge, any of the versions of Internet Explorer, Google Chrome, Firefox, etc. The site you're on will automatically update to reflect the browser of your choice. Just don't forget to go back! The User Agent option in Safari should cover almost all the reasons for using Internet Explorer on your Mac. However, if you absolutely need to launch Internet Explorer itself for one reason or another, you can also try it with the help of a virtual machine. Start Internet Explorer on a virtual machine While using a virtual machine for Internet Explorer is by no means an easy solution, it is still there for those in need. What the virtual machine essentially does is install a large-scale copy of Windows on your Mac and allow you to launch it as an app within macOS. From there you can launch Internet Explorer or, in fact, any program you miss from your Windows days. To set up the virtual machine, you first need to buy a copy of some virtual machine software (VMware Fusion is a good one) and a license for Windows. Once you have these in place: Download both the VMware fusion and the Windows LADIQUE VMware Fusion ISO fileIn the installation method window, choose Create a new custom virtual machineDrag and drop your Windows ISO file in the Click FinishRelaunch dialog window the virtual machine and click the play button to configure Windows Now every time you need to use Internet Explorer on Mac , you can just start the virtual machine and use IE directly with Windows that way. There are certainly some disadvantages to this solution. First, you have to purchase both VMware Fusion and a licensed copy of Windows for the sole purpose of using Internet Explorer. Secondly, virtual machines tend to be quite heavy on your processor because they are running the entire operating system within them. Another option available to you in case you don't specifically need to use IE for Mac, but rather move away from Safari is to switch to any other third-party browser, all of which are available on macOS. Use third-party browsers on Mac If Safari is not your first browser of choice and using Internet Explorer for Mac is at least quite complicated, you can download any other stable and widely used browser out there and make it the default on your macOS. Google Chrome By far the most Today's browser, Google Chrome currently commands 45-65% browser market share. Developed by Google, the browser is available on desktop and mobile devices, and thus has a significant amount of plugins and web applications unique to it. Chrome has also been praised for its speed and tight integration with all other Google products. As for the downsides, using Chrome means being subjected to Google's permatng crawl and helping Google effectively monopolize the web. Firefox Firefox is another great daily browser. Heir to the first commercial browser called Netscape, it is an open source program owned by the non-profit Mozilla Foundation. Firefox is fast, secure and has a worldwide support community. All this makes it a great alternative to Safari and Internet Explorer. Brave Brave is a newcomer to the browser arena who first appeared only in 2015. Based on the open source Chromium project (just like Google Chrome), the browser quickly gained loyal followers due to its aggressive privacy controls and ad blocking. Turning Brave into your default browser may seem a bit experimental at this point, but nevertheless, it presents a good option for anyone concerned about privacy. Microsoft Edge Although it hasn't been available on macOS since early 2019, Microsoft has announced that it is rewriting the Edge browser engine to run on Chromium (such as Google Chrome and Brave), which means it will become compatible with macOS as well after launch. Fingers crossed, but in the meantime you can choose one of the alternative browsers listed above. Overall, these are your three options for running Internet Explorer on your Mac. You can use Safari User Agent to view any web page, just as Internet Explorer would, start the real Internet Explorer browser through a virtual machine running Windows, or choose one of the alternate browsers if all you want to do is get away from Safari on your Mac. However, if you're new to mac, a browser may not be the only thing you're worried about. You also need to find applications to cover all kinds of issues related to optimization, organization, security, and productivity. Essential apps for all new Mac owners So you switch from PC to Mac, you realize that unfortunately not all the apps you loved and used daily are available on macOS. So naturally, you need to find suitable replacements. The good news is that Mac has plenty of great apps for everything you need. But how do you choose and decide which ones are worth your time? That's where a platform like setapp becomes indispensable. Setapp is a collection of more than 150 applications and utilities essential for Mac that all possible use cases and scenarios. All apps in the collection are automatically updated to their latest versions and new apps are added regularly. It's a godsend for new and experienced Mac users. Discover new apps that are the best at what they do? How can I not like it? Here is an essential introductory set of some of the applications presented at that all new Mac users should have. Bartender A light utility playing a vital role, bartender keeps his bar menu clean and tidy. As you use your Mac more and more, each new app would like to be presented in its menu bar (top right). This quickly becomes unsustainable, and instead of quick access to the apps you need, you'll spend more time just trying to find the right one. The default mac organization settings for menu bar are pretty basic, allowing only you to reshuffle icons. The bartender allows you to hide them under a single icon and exaggebe only the ones you need to use at the moment. Ulysses Praised as the best writing tool for years, Ulysses has a clean interface and allows you to focus on the writing process, whether for simple notes, speeches or anything in between. And application Markdown support makes it much more web-friendly, allowing direct exports to WordPress and Medium. Disk Drill No one ever wants to lose their files, no matter if it is due to physical damage or accidental deletion. Disk Drill solves this problem, essentially ensuring and giving you the option to recover your files. As the most widely used data recovery tool around, Disk Drill helps you back up your files regularly and save lost files from damaged hard drives if things go south. CleanMyMac X The ultimate Mac optimization app, CleanMyMac X keeps your Mac free of any junk, safely and completely uninstalls from old applications, and protects you from being affected by malware. Just launch CleanMyMac X once a month to do a full scan of your computer and you'll ensure the top condition of your Mac. Best of all, Bartender, Ulysses, Disk Drill, CleanMyMac X and all other apps featured on Setapp are available to you in a free trial. Just launch Setapp and try as many apps as you want, turning your transition to Mac from a chore to a pleasurable discovery. Discovery.
